

Substate

Notation : `substate`

Description : A smaller, temporary state `transaction_substate` is generated during transaction execution. It contains three sets of data:

- The accounts tagged for self-destruction following the transaction's completion. `self_destruct(accounts)`
- The `logs_series`, which creates checkpoints in EVM code execution for frontend applications to explore, and is made up of the `logs_set` and `logs_bloom` from the `tx_receipt`.
- The refund balance.¹

1. The `SSTORE` operation increases the amount refunded by resetting contract storage to zero from some non-zero state.
